

Group Assignment · From Data to App

Work in: Your group

Deadline: Monday, 21 September

Hand in: Live app URL + repository + short video

Your task

Use what you learned in **Session 4 (Data Visualization & Storytelling)** and **Session 5 (Rapid Prototyping)** to turn live data into a simple interactive app.

Choose **one free API** from freepublicapis.com. Do **not** use an API that requires payment.

Then:

1. Identify your target audience and explain why this issue matters to them.
2. **Ask one interesting question** that the API data can help answer.
3. **Create one clear visualization** that tells a story or shows an interesting comparison.
4. **Build a simple interactive app** in Streamlit.
5. Let the user change at least **one important thing** in your analysis, such as a country, category, date, time period, or comparison group.

Example

API: Weather data

Question: Is Aalborg colder than Copenhagen this week?

Visualization: Temperature comparison

App: User chooses the two cities to compare.

Your app should include

- Data from a **free API**
- At least **one visualization**
- At least **one interactive control**
- A short explanation of what the visualization shows
- A short note about one **limitation** of the data

Your app should also give a clear message if the API does not return data or is temporarily unavailable.

Hand in

- **Live app URL** that we can open

- **Repository** with your code and requirements.txt
- **3–5 minute video** where everyone speaks and you demonstrate the app
- In the README, briefly state which **AI/tools** you used and what you used them for

Important: Never upload API keys or passwords to your repository.

What matters

We are mainly looking for three things:

Target audience → Data → Story → App

Can you understand the API data, find a meaningful comparison, communicate it clearly with a visualization, and turn it into a simple interactive application?
